✅ Month 4 - Project Title: Build a Content-Based Movie Recommendation System

👨‍💼 Client Overview
A startup wants to build a basic recommender engine for users based on movie descriptions, genres, cast, and keywords.

🎯 Project Objective
Build a content-based recommendation system using text features like description, cast, and genres with cosine similarity.

📦 Dataset

TMDB 5000 Movie Dataset (Kaggle)

🔧 Step-by-Step Project Requirements

1. Data Cleaning
    - Combine overview, genres, keywords, cast into a single tags column
    - Convert to lowercase, remove punctuation
2. Vectorization
    - Use CountVectorizer or TfidfVectorizer
    - Calculate cosine similarity matrix for all movies
3. Recommendation Logic
    - Create recommend(title) function
    - Return top 5 similar movies based on cosine distance
4. (Optional) Streamlit App
    - Add text input and display movie posters of recommendations
5. Deliverables
    - Jupyter notebook with recommender logic
    - Pickled vectorizer and similarity model
    - Screenshot of UI (if app is built)
